

Preamplifier for High Resolution Computer Display

Description

The CXA2055P is a bipolar IC developed for high resolution computer displays.

Features

- Built-in wide band amplifier
(130 MHz/−3 dB typ. @ 4 Vp-p)
- Input dynamic range : 1.0 Vp-p (typ.)
- R, G and B in a single package
- I²C bus control
 - Contrast control
 - Subcontrast control
 - Brightness control
 - OSD contrast control
 - Power save function
 - Input clamp pulse polarity selection
 - Output composite sync polarity selection
 - 5-channel, 8-bit D/A
 - Blanking level control
- Built-in sync separator (G channel only)
- Built-in blanking mixing function
- Built-in OSD mixing function
- Built-in ABL function
- Video interval detection function

Applications

High resolution computer displays

Structure

Bipolar silicon monolithic IC

28 pin DIP (Plastic)

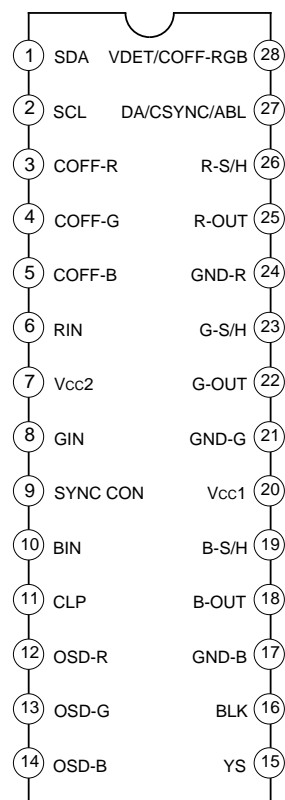

Absolute Maximum Ratings (Ta=25 °C)

- Supply voltage V_{CC} 14 V
- Operating temperature
 - T_{opr} −20 to +75 °C
- Storage temperature T_{stg} −65 to +150 °C
- Allowable power dissipation
 - P_D 1794 mW
 (when mounted on a 11.5 cm × 12.0 cm substrate)

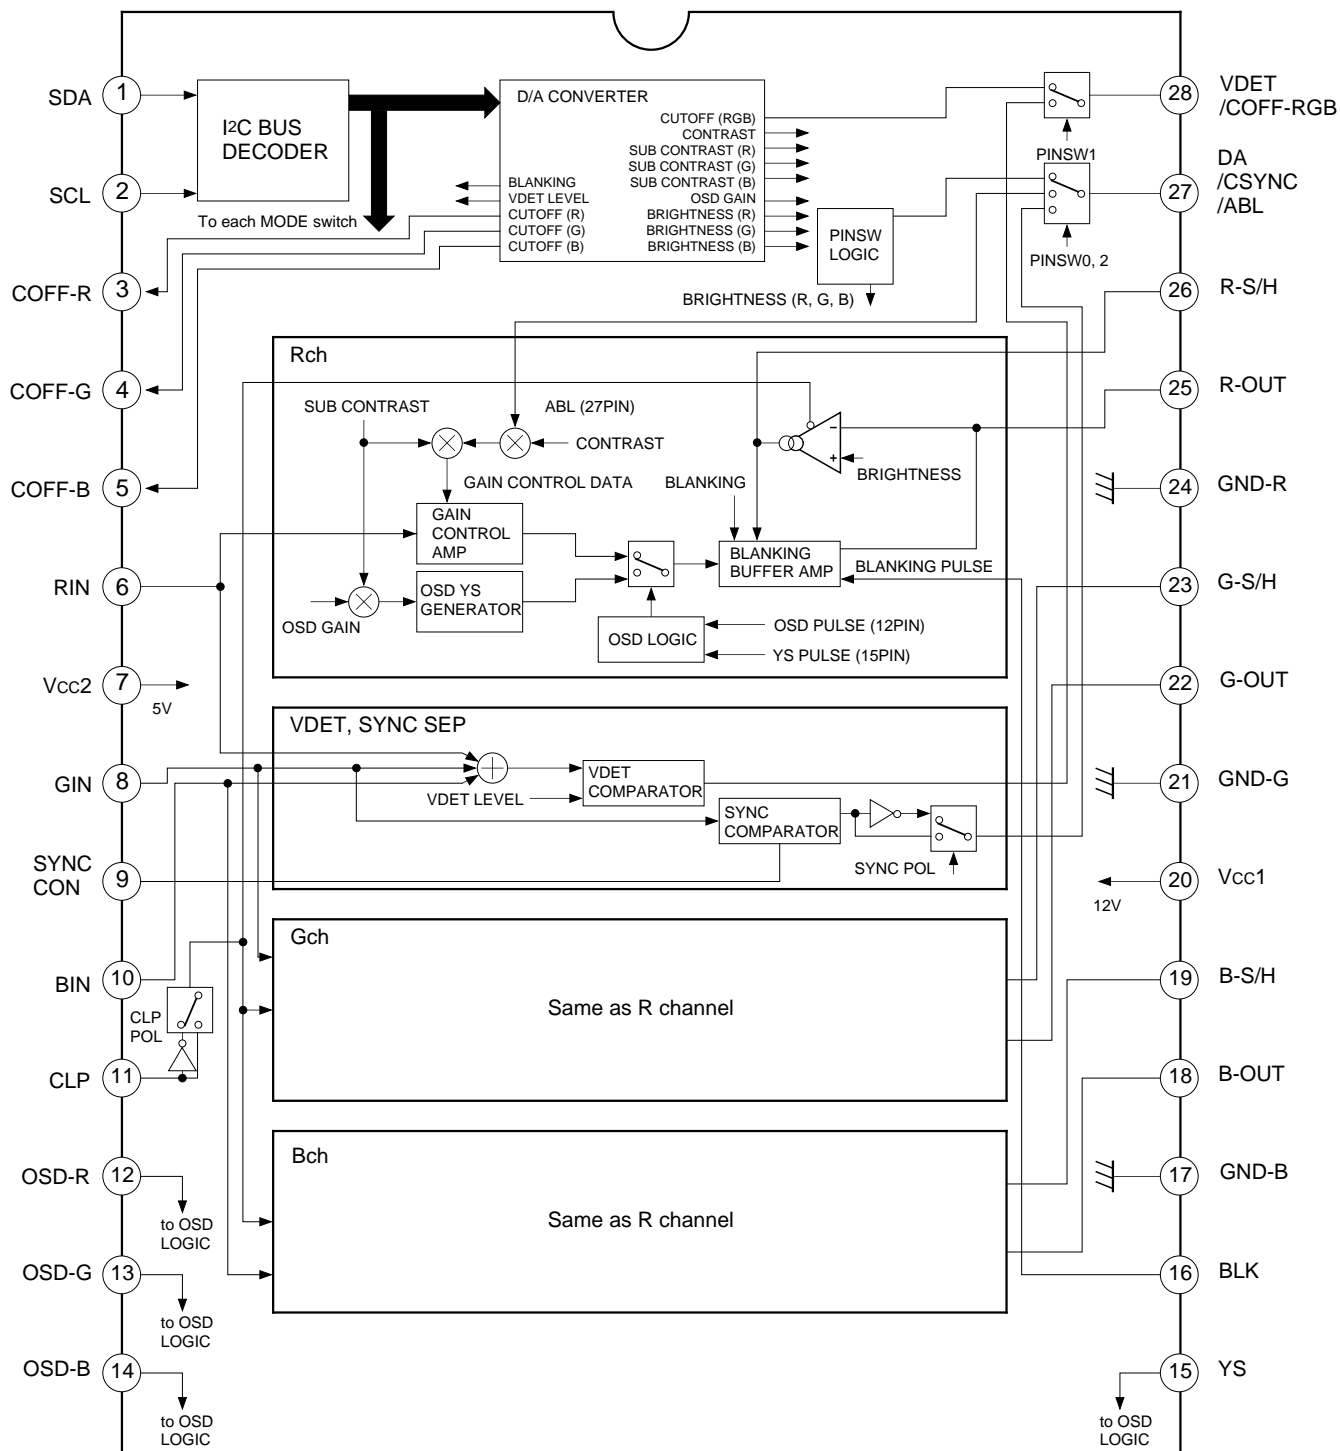

Operating Conditions

Recommended supply voltage

V _{CC1}	12±0.5	V
V _{CC2}	5±0.25	V

Sony reserves the right to change products and specifications without prior notice. This information does not convey any license by any implication or otherwise under any patents or other right. Pin Description

Pin No.	Symbol	Pin voltage	Equivalent circuit	Description
1	SDA	—		I ² C bus address and data input.
2	SCL	—		I ² C bus clock signal input.
3	COFF-R	—		D/A converter outputs. The variable range is 1 to 4 V. Use as cut-off control voltages is recommended.
4	COFF-G			
5	COFF-B			
6	RIN	—		R, G and B inputs. When clamped, the input voltage black level is approximately 3.2 V. Connect 0.1 µF or more in series as a clamp capacitor.
8	GIN			
10	BIN			
7	Vcc2	5 V		5 V power supply.

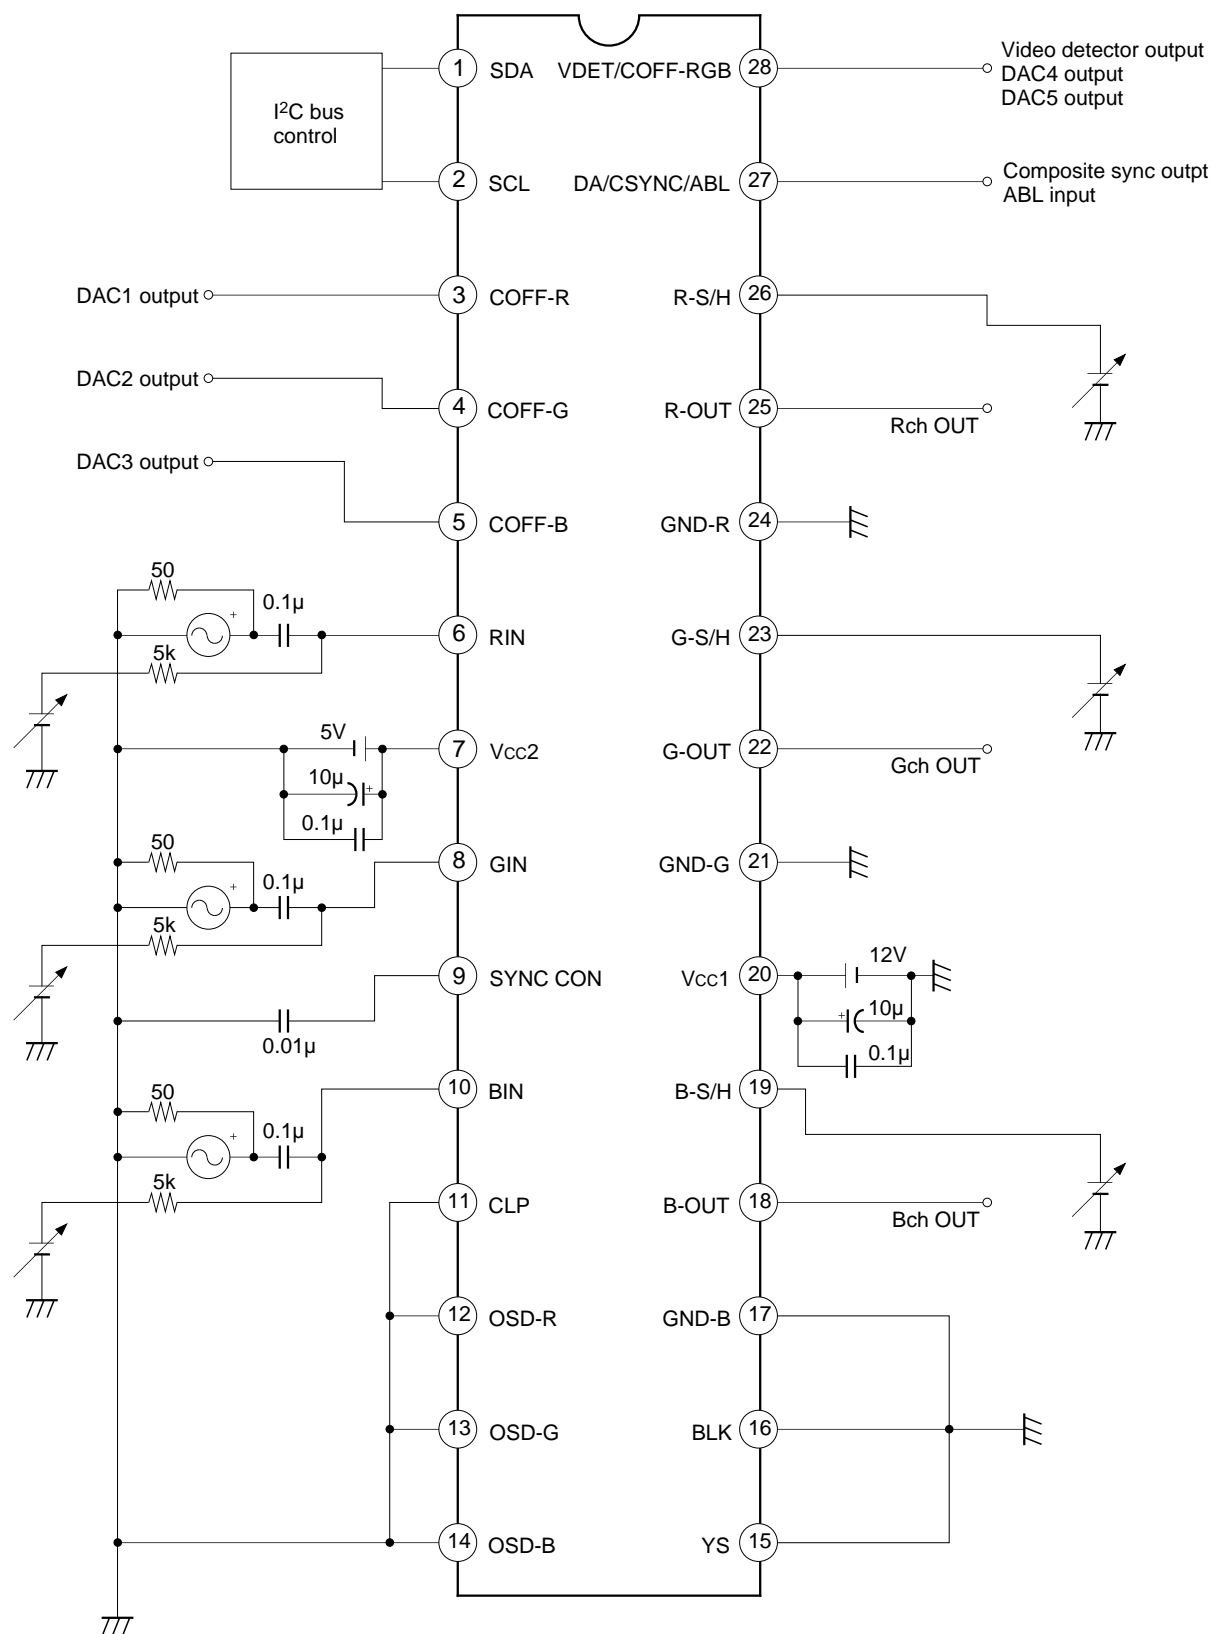

Pin No.	Symbol	Pin voltage	Equivalent circuit	Description
9	SYNC CON			Sync signal separation circuit block during sync-on-video signal input. Connect a sample-and-hold capacitor.
11	CLP	—		Clamp pulse input. The polarity can be switched via the I ² C bus. The threshold level is approximately 1.3 V.
12	OSDR	—		R, G and B OSD pulse inputs. The threshold level is approximately 1 V.
13	OSDG			
14	OSDB			
15	YS	—		OSD-BLK pulse input. The threshold level is approximately 1.7 V.
16	BLK	—		BLK pulse input. The threshold level is approximately 1.5 V.

Pin No.	Symbol	Pin voltage	Equivalent circuit	Description
17	GND-B	0 V		R, G and B independent GND.
21	GND-G			
24	GND-R			
18	B-OUT	—		R, G and B outputs.
22	G-OUT			
25	R-OUT			
19	B-S/H	—		Connection for external sample-and-hold capacitor (0.1 μ F).
23	G-S/H			
26	R-S/H			
20	Vcc1	12 V		12 V power supply.
27	DA /CSYNC /ABL			General-purpose D/A converter output. Composite sync output. TTL drive is possible. $V_L=0.5$ V or less, $V_H=4.0$ V or more RGB output amplitude gain compensation input. (common for all three channels) Function switching is performed via the I ² C bus.
28	VDET /COF-RGB	—		Video signal detection output. $V_L=0.5$ V or less, $V_H=4.0$ V or more General-purpose D/A converter output. The variable range is 1 to 4 V. Function switching is performed via the I ² C bus.

Electrical Characteristics Measurement Circuit

Electrical Characteristics Measurement Circuit (For AC Measurement)

Electrical Characteristics

12	Rise time	t_R	—	—	1000	ns
13	Fall time	t_F	—	—	300	ns
14	Minimum waiting time for stop preparation	$t_{SU ; STO}$	4.0	—	—	μ s

I²C BUS Control Signal

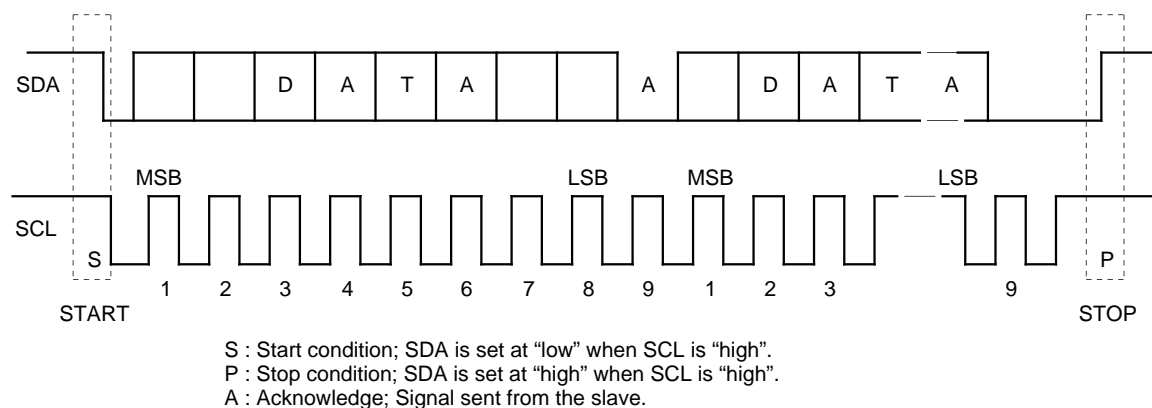

1. Application

The CXA2055P is a preamplifier for computer displays, and combines three R, G and B channels into a single package. All controls such as the contrast and black level for each channel are performed via I²C bus control.

1) I²C bus

Two wires (SDA, SCL) provide control over start, stop, data transfer, synchronization and collision avoidance. The IC outputs are either open collector or open drain, forming a bus line in the wired OR format. The bus signal configuration is as follows.

Data is transmitted by MSB-first. One data unit consists of 8 bits, to which the acknowledge signal, which indicates that the data has been accepted by the slave, is attached at the end. Normally, the slave *¹ IC receives data at the rising edge of SCL and the master *² IC changes data at the falling edge of SCL. The actual data format is as follows.

S	Slave address 40H	A	Subaddress **H	A	DATA0	A	DATA1	A	DATA2	A	P
---	----------------------	---	-------------------	---	-------	---	-------	---	-------	---	---

Slave address configuration

BIT8	BIT7	BIT6	BIT5	BIT4	BIT3	BIT2	BIT1
Slave address							R/W

The slave address is an address unique to each IC, and is assigned according to the IC functions. The upper 7 of the 8 bits are the unique address and the final bit is the R/W bit. The R/W bit indicates read *³ when 1 and write *⁴ when 0. 40H is allotted as the slave address for the CXA2055P. (This is write only and there is no read mode.)

The subaddress is the assigned address within the IC, and is used for the various IC adjustments. The subaddress is sent just once following the slave address, and is automatically incremented thereafter until a stop condition is sent.

*¹ Slave : An IC that is placed under the control of the master.

In a normal system, all devices excluding the central microcomputer are slaves.

*² Master : A central microcomputer or other controlling IC.

*³ Read : Mode where data is read from master to slave.

*⁴ Write : Mode where data is written from master to slave.

2) Register map

- Slave address : 40H
- “*” indicates undefined.
- Values inside parentheses () are the initial setting values (during power-on reset)
(undetermined when not indicated)

Slave address configuration

BIT8	BIT7	BIT6	BIT5	BIT4	BIT3	BIT2	BIT1
0	1	0	0	0	0	0	R/W

SUB ADDRESS	BIT7	BIT6	BIT5	BIT4	BIT3	BIT2	BIT1	BIT0
00H	CONTRAST							
01H	SUB CONTRAST R							
02H	SUB CONTRAST G							
03H	SUB CONTRAST B							
04H	*	*	OSD GAIN				BRT MODE (2)	
05H	BRIGHTNESS R (DA)							
06H	BRIGHTNESS G							
07H	BRIGHTNESS B							
08H	CUT OFF RGB							
09H	CUT OFF R							
0AH	CUT OFF G							
0BH	CUT OFF B							
0CH	BLK (0) MODE	*	BLANKING LEVEL (0)					
0DH	BRT SW (0)	SYNC POL (0)	VDET MODE (0)	POWER SAVE (0)	*	CLP (0)	VDET LEVEL	
0EH	*	*	*	*	D/A TEST (0)	PINSW2 (0)	PINSW1 (0)	PINSW0 (0)

3) Description of registers (Numbers inside parentheses () indicate the number of bits.)

CONTRAST (8)	: Adjusts the R, G and B-OUT (Pins 25, 22 and 18) output amplitude gain commonly for all three channels.
SUB CONTRAST (8)	: Adjusts the R, G and B-OUT (Pins 25, 22 and 18) output amplitude gain independently for each channel.
OSD GAIN (4)	: Adjusts the OSD R, G and B (Pins 12, 13 and 14) OSD interval output signal gain commonly for all three channels.
BRTMODE (2)	: This register changes the output dynamic range. The 2H setting is recommended. 0H : Output dynamic range 0.5 V to 4.5 V 1H : Output dynamic range 0.5 V to 5.5 V 2H : Output dynamic range 1.0 V to 6.5 V (recommended) 3H : Output dynamic range 2.0 V to 7.5 V
BRIGHTNESS (8)	: Controls the output black level potential. (Three-channel independent and common control can be selected by BRTSW. During three-channel common mode, control is performed by the G channel.)
CUT OFF (8)	: This is a general-purpose DAC. Use as a cut-off control is recommended.
BLK MODE (1)	: Switches the blanking level mode 0H : BLK LEVEL=fixed 1H : BLK LEVEL=variable
BLANKING LEVEL (6)	: Sets the blanking level when BLK MODE is set to 1H.
BRTSW (1)	: Switches the brightness control between three-channel independent and three-channel common control. When using three-channel common mode, the BRIGHTNESS G channel is valid. 0H : Three-channel independent mode 1H : Three-channel common mode
SYNC POL (1)	: Switches the sync separator output polarity during sync-on-green input. 0H : Positive polarity 1H : Negative polarity
VDET MODE (1)	: Switches the video signal detection mode. 0H : B channel only is detected 1H : Signal obtained by adding R, G and B signals is detected
POWER SAVE (1)	: Power save mode selector switch. 0H : Power save not performed 1H : Power save performed

- CLP (1) : Selects the input clamp pulse polarity.
 0H : Positive polarity input
 1H : Negative polarity input
- VDET LEVEL (2) : Threshold level selector switch for video interval detection. The threshold level changes as follows.
 (An input pulse width of as narrow as 10 ns can be detected.)
 When VDET MOD=0H When VDET MOD=1H
 0H : 300 mV or more 0H : Undetectable
 1H : Undetectable 1H : Undetectable
 2H : Undetectable 2H : 300 mV or more
 3H : Undetectable 3H : 600 mV or more
Note) The threshold level when VDET MOD=1H is the total of the three channel inputs.
- D/A TEST (1) : DA TEST switch for IC measurement. Set to 0H.
- PINSW : Switches the Pins 27 and 28 functions. (“*” indicates don't care.)

PINSW			Pin 28 output	Pin 27 output
2	1	0		
0	0	0	DA (COFF_RGB)	C-SYNC
1	0	0	DA (COFF_RGB)	ABL (CONTRAST)
0	1	0	VDET	C-SYNC
1	1	0	VDET	ABL (CONTRAST)
*	0	1	DA (COFF_RGB)	DA (BRIGHTNESS)
*	1	1	VDET	DA (BRIGHTNESS)

Note) When the Pin 27 output is set to DA (BRIGHTNESS), BRIGHTNESS is forcibly set to the three-channel common mode.

2. Blanking addition function

The output is blanked while the BLK pin (Pin 16) is high level.

The BLK pin threshold level is approximately 1.5 V.

3. OSD addition function and OSD contrast control

OSD can be added to the video signal while the OSD-R, G and B pins (Pins 12, 13 and 14) are high level.

OSD blanking is added when any of these three channels is high level.

OSD blanking is also added to all three channels while the YS pin (Pin 15) is high level. See the following logic.

4. CONTRAST function

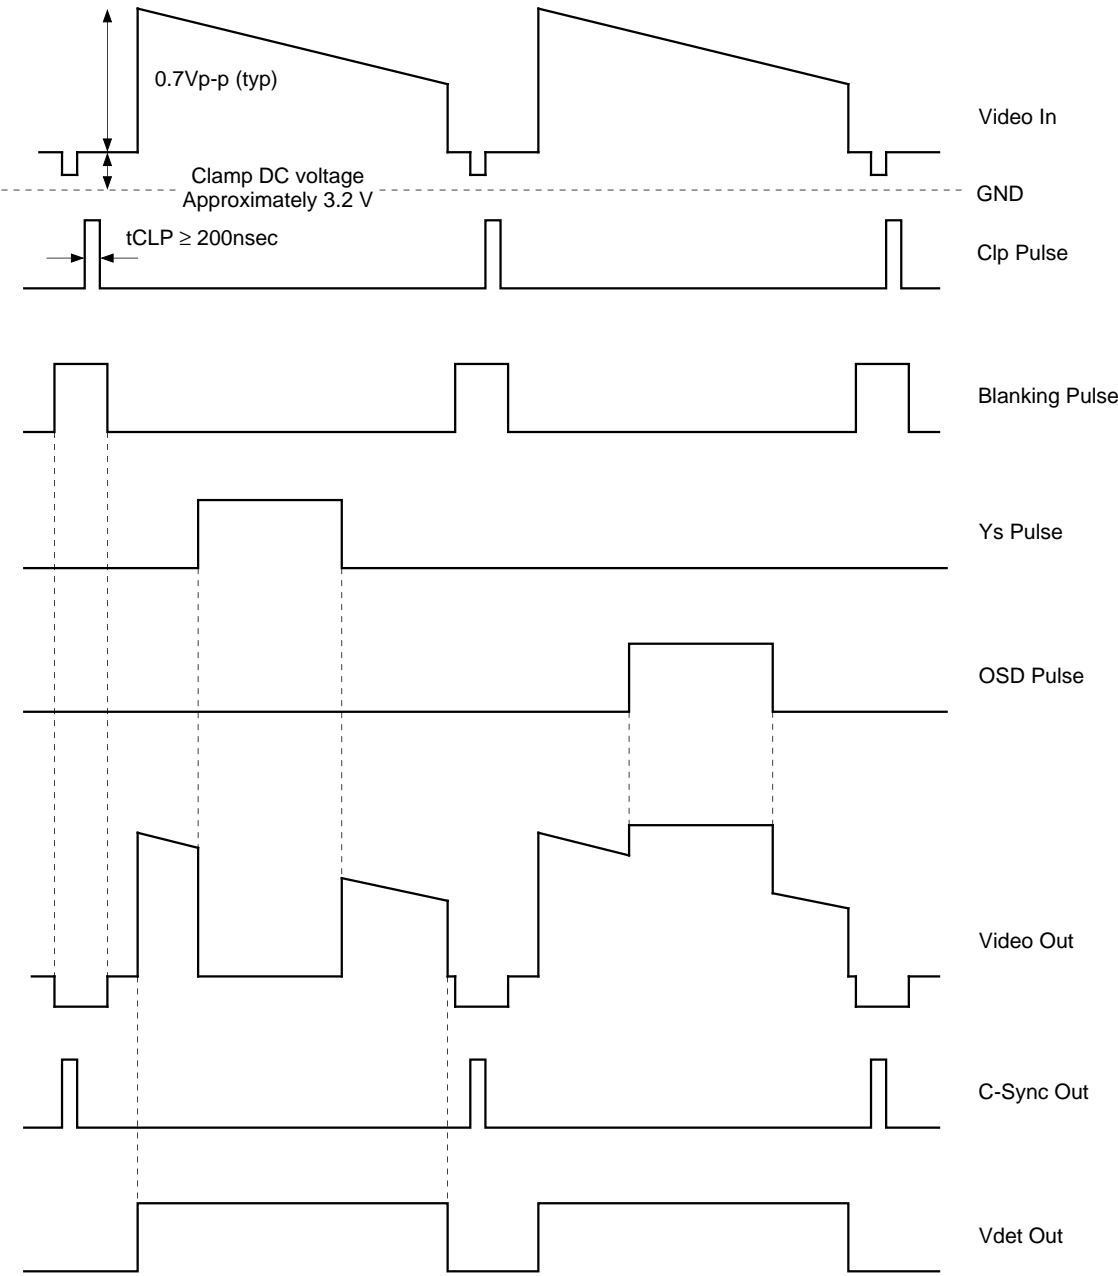

The CONTRAST function performs gain control for the R, G and B-OUT output amplitudes.

5. ABL function

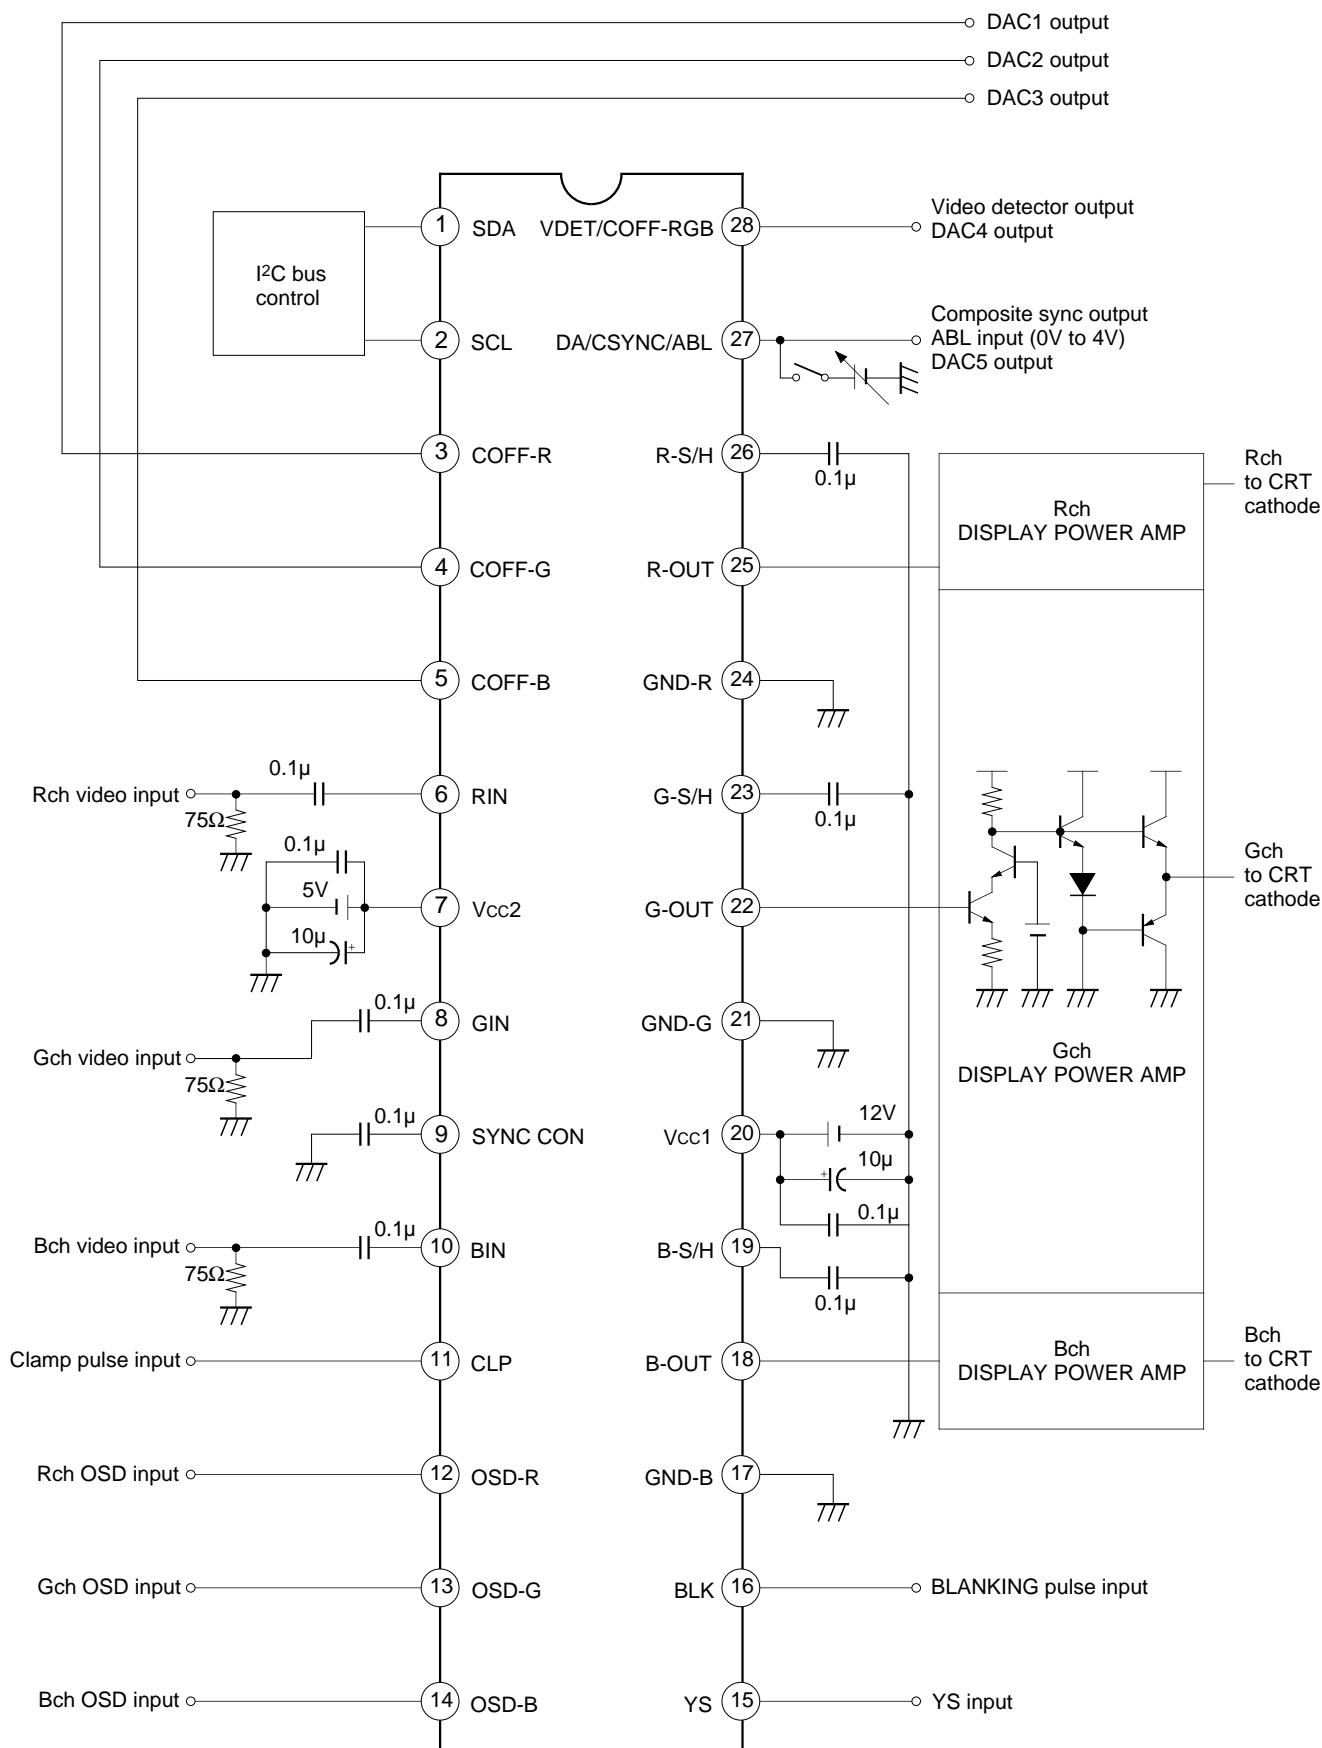

ABL control can be performed by Pin 27 by setting PINSW. The variable range is approximately 13.7 dB.

See the characteristics diagrams hereafter for the control characteristics.

I/O Signal Example

Application Circuit

Application circuits shown are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits or for any infringement of third party patent and other right due to same.

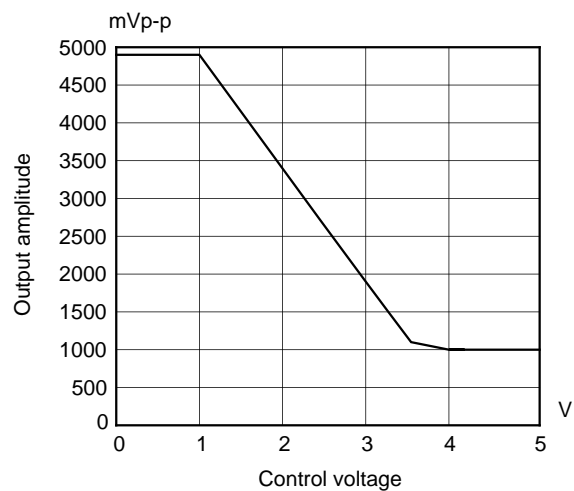

Notes on Board Pattern and Layout

1. When not using the OSD, YS or BLK pins, connect these pins to GND.
2. Care should be taken for the following items regarding the output signals from R, G and BOUT.
 - 1) Connect these signal lines so that they are high impedance to external circuits.
 - 2) Do not allow current to flow into the IC side.
 - 3) Arrange the signal lines so that the distance to the power amplifier is as short as possible.
3. The Vcc1 and Vcc2 decoupling capacitors should consist of ceramic capacitors and electrolytic capacitors connected in parallel, and should be connected as close to the IC as possible.
4. The R, G and BIN clamp capacitors should be located as close to the IC as possible.
5. The sample-and-hold capacitors connected to the R, G and B-S/H pins should be connected as close to the IC as possible.
6. The output signals from COFF-R, G and B should be arranged so that capacitance of 20 pF or more is not applied to the pins or the pattern.
